Vicinity Manufacturing™ Announces Bar Coding Integration

*FORMULA MANUFACTURING SOFTWARE VENDOR PARTNERS WITH LEADING DATA
COLLECTION COMPANY, ACCELLOS.*

ATLANTA, GA, JANUARY 21, 2009: Today, Microsoft Gold Certified software vendor, Vicinity Manufacturing™, announces immediate integration with external data collection systems such as Bar Coding and Warehouse Management. Maximum Data, an Accellos company, became the first automated data collection company to partner with Vicinity through its In Touch Manufacturing Solutions for Microsoft Dynamics® GP. The In Touch Solution allows manufacturers to collect and track real-time data on all finished goods. By employing bar-coding at the package line, formula manufacturers will improve the speed and accuracy of their finished goods recording. The data obtained from In Touch allows for measurement of actual inventory of hand, which is vital for efficient warehouse management and inventory control.

Vicinity Manufacturing co-founder and CEO, Randy Smith, said, “Our formula manufacturing clients were searching for a way to automate the recording of finished

goods on the production floor. Because of Vicinity's universal architecture, we can offer a standard web service for any data collection system to use." Mr. Smith continued by saying, "We have always been impressed with Accellos's products and felt that they were the ideal partner in moving forward with our data collection development. Formula manufacturers needing to record real time data on finished goods now have a complete solution with In Touch and Vicinity."

Vicinity Manufacturing plans to continue its developmental efforts in real time data collection; the company plans to offer bar coding on raw material usage as a standard feature within the first part of 2009.
